

OpenAI API for Beginners: Create AI Assistants with ChatGPT

Key Takeaways

Task 1

Title: Installing Python Libraries

- Python libraries are collections of pre-written code and functions that extend the capabilities of the Python programming language
- You'll need the following libraries to develop this project: openai, dotenv, and os.
- Libraries are installed with the pip command.

Task 2

Title: Obtaining an API Key and Establishing Connection

- The website to use is www.platform.openai.com
- Generate project-specific keys.
- You can create multiple keys and set different permissions for each one.
- The constructor function `OpenAI()` initializes your OpenAI instance.
- The `openai.chat.completions.create()` function generates a response from the api.

Task 3

Title: Defining the 'chatbot' function

- Chatbot function is the core of the chatbot.
- While True loop keeps the chatbot continuously running.
- Make sure to add a break clause to the loop.

Task 5

Title: Handling common errors

- Remember to take into consideration human and machine errors.
- Common openAI API errors include Authentication, Rate limit and APIConnection errors.
- Make sure to handle unknown errors that might arise.

Task 6

Title: Tailoring the Chatbot's role and responses

- You can set the instructions and the knowledge base of your assistant in the content of the system role, while generating a response using the `client.chat.completions.create()` function.
